our decision to dedicate several years to the writing of this atlas was based on the professional acknowledgement of negative surgical results due to incorrect or incomplete approaches to the bones or joints requiring treatment we are convinced that in order to obtain the best possible

anatomic and functional results in surgery of the locomotor apparatus it is necessary to obey several rules of behaviour constituting the basis for correct surgical execution a to respect the anatomy of the muscular and neural formations b to safeguard the vascularization of these anatomical elements and consequently of the osteoarticular apparatus c to use the most appropriate surgical approaches fully respecting the regional anatomy and the least traumatic exposure of the skeleton d to correctly perform surgery thus creating the best conditions for the excellent recovery of the function of the limb the anatomic findings and surgical approaches to the extremities described here are not complete we have based our selection of the former on their frequency in the normal surgical activity of any specialised ward and the latter on the surgical approaches most commonly used by the 3rd division of the rizzoli orthopaedic institute wide surgical approaches for the surgical treatment of bone tumors have been excluded as they deal with specific compartmental methods which do not involve the anatomic rules to be followed in the normal treatment of orthopaedic and traumatic affections of the extremities

excerpt from essays in surgical anatomy and surgery in the winter of 1876 in some statements made before the new york county medical society upon the subject of one of these essays upon which i was then engaged i earnestly censured the practice of tying the common carotid for any lesion of the external carotid or its branches when there was one half an inch between the lesion and the bifurcation of the primitive trunk my conclusions met with the approval of two eminent surgeons themselves professors of surgical anatomy in the college of physicians and surgeons and the bellevue hospital college and within the last year several younger american surgeons have with creditable skill ligatured the branches of the external carotid rather than tie the common trunk I these few instances with those gathered in these pages will i hope inaugurate a new era in the operative surgery of the neck and will furthermore encourage younger men not to accept any procedure no matter how high the authority which endorses it unless it stands the test of a critical analysis in gleaning from the almost boundless field of professional literature the surgical histories of the great vessels of the neck it has been my aim to arrive at the truth positive and indisputable i have accepted nothing that was not satisfactorily stated not wishing to swell the manuscript with irrelevant matter to this end i have omitted several hundred cases of deligation of these vessels heretofore published those of the subclavian² artery when from the description of the operation i was satisfied that the axillary was the vessel tied those of the other vessels when the results were not given or the operation couched in uncertain terms about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

from the renowned centers for surgical anatomy and technique of Emory University here is the revised and updated definitive memory refresher for the practicing surgeon and the surgical resident entering the operating room the new sections on panoramic laparoscopic cadaveric anatomy of the inguinal area kugel hernia repair laparoscopic inguinal hernia repair transhiatal esophagectomy laparoscopic Nissen fundoplication laparoscopic sigmoid colectomy laparoscopic splenectomy and laparoscopic adrenalectomy are all presented in the same concise accessible and generously illustrated format as the first edition the carefully outlined and practical explanations of anatomy and how it pertains to general surgery will help the general surgeon in avoiding complications and in developing masterful surgical technique now more than ever surgical anatomy and technique is a must have for every resident and general surgeon

the object of this work is to present to the student of medicine and the practitioner removed from the schools a series of dissections demonstrative of the relative anatomy of the principal regions of the human body whatever title may most fittingly apply to a work with this intent whether it had better be styled surgical or medical regional relative descriptive or topographical anatomy will matter little provided its more salient or prominent character be manifested in its own form and feature the work as I have designed it will itself show that my intent has been to base the practical upon the anatomical and to unite these wherever a mutual dependence was apparent that department of anatomical research to which the name topographical strictly applies as confining itself to the mere account of the form and relative location of the several organs comprising the animal body is almost wholly isolated from the main questions of physiological and transcendental interest and cannot therefore be supposed to speak in those comprehensive views which anatomy taken in its widest signification as a science necessarily includes while the anatomist contents himself with describing the form and position of organs as they appear exposed layer after layer by his dissecting instruments he does not pretend to soar any higher in the region of science than the humble level of other mechanical arts which merely appreciate the fitting arrangement of things relative to one another and combinative to the whole design of the form or machine of whatever species this may be whether organic or inorganic the descriptive anatomist of the human body aims at no higher walk in science than this and hence his nomenclature is as it is a barbarous jargon of words barren of all truthful signification inconsonant with nature and blindly irrespective of the *cognitio certa ex principiis certis exorta* still however this anatomy of form although so much requiring purification of its nomenclature in order to clothe it in the high reaching dignity of a science does not disturb the medical or surgical practitioner so far as their wants are concerned although it may and actually does trammel the votary who aspires to the higher generalizations and the development of a law of formation yet as this is not the object of the surgical anatomist the nomenclature such as it is will answer conveniently enough the present purpose the anatomy of the human form contemplated

in reference to that of all other species of animals to which it bears comparison constitutes the study of the comparative anatomist and as such establishes the science in its full intent but the anatomy of the human figure considered as a species per se is confessedly the humblest walk of the understanding in a subject which as anatomy is relationary and branches far and wide through all the domain of an animal kingdom while restricted to the study of the isolated human species the cramped judgment wastes in such narrow confine whereas in the expansive gaze over all allying and allied species the intellect bodies forth to its vision the full appointed form of natural majesty and after having experienced the manifold analogies and differentials of the many is thereby enabled when it returns to the study of the one to view this one of human type under manifold points of interest to the appreciation of which the understanding never awakens otherwise if it did not happen that the study of the human form confined to itself had some practical bearing such study could not deserve the name of anatomical while anatomical means comparative and whilst comparison implies inductive reasoning

this new book is designed to facilitate the comparison between normal and abnormal anatomy both on the surface and by the use of radiologic imaging within the body general surgical anatomy and examination explores the common problems that a surgeon may encounter and detect not only by radiologic imaging but also by seeing hearing and feeling using a series of color photographs and radiologic images many with interpretive line drawings and overlays to show normal and abnormal instances the book illustrates how anatomy clinical history and examination can be used to point at the diagnosis in patients with surgical conditions the text is short yet comprehensive and is closely linked to the visual presentation of the surgical disease
